Drones are really something that have recently grown in a short period of time. There has lately been many reports about drones. These drones can be used for a couple of reasons. Drones have a really good use to them but they also have a great negative part to them. These drones are very commonly used throughout used the world for many reasons.

There is a huge variety of drones. There are small toy drones which really do not have a big use to them other than the great entertainment to fly it. Then there is the common among the public which is the "Quadcopter Drone" which usually has camera. This is a quadcopter which is controlled usually by a smartphone or tablet. The quadcopter is flown around your area and records as it is in the air. It is quite neat how it works and can surely be the technology from the twenty-first century.

The problems that drones can solve range far. They can solve problems for big photographers because the quality of the camera is out of the world! It also has the advantage to get a higher and wider view. This is great for landscaping views and recording action scenes. Drones also help the military a lot because these are wide range devices and if something goes wrong nobody is hurt because it is controlled by a remote or computer. Drones can also help many farmers, they can see how their crops are evolving without them having to walk all around. The only thing that this might affect

is your wallet because they do come very high priced.

Although that this is a very good modern technology device there are some negative sides to this. Such as flying drones near airports. Which is illegal and can put you in some serious legal problems. This can also be very dangerous for the people in the airplane because the drones can cause interference and cause the airplane to crash drastically. Other times people want to record a wildfire. This too can cause something very drastic because when the airplanes are flying over to put it out it interferes with the signal and when there is a caution such as this one it makes the airplane go back to ground. The one bug that quadcopters have is that the battery life is really bad. On a full charge you only get about 20 minutes of flying time.

In conclusion, drones are amazing twenty-first century technology devices. It could affect people by entertaining because it looks quite fun when people fly them. It will mostly solve photographers problem, but also the military because of its many uses. It can improve if people had precaution and obeyed the laws. I see that the product will grow a lot in the future and will be more commonly used.
